

Internal structure: routing potential and observed DOC variability

a Routing with the same mean path delay

b Observed DOC does not follow a universal ordering

a: fixed-input scenarios in 320 networks with junctions; lower peaks do not mean less total DOC. b: 22 receivers; ● native concentration, ■ log1p.
b: 5,000 whole monitoring-system bootstrap 95%; systems span profiles. Basin size and monitoring coverage differ; adjusted associations are reported separately.
