

How structure acts: incoming clocks × post-junction mixing

a/b: Real paths at station 03030852; c: 295 real junction corridors; d: Five measured confluences.

a-c: Constant-flow conservative concentration scenarios; 50% shared-time mixing is prescribed, not measured DOC attenuation.

c: HUC4-block 95% intervals. d: Width × observed mean depth is a rectangular proxy, not exact wetted area.
