

Do different river forms have stable differences in observed DOC?

Fixed environment/area-matched rivers within HUC4, identical dates; bottom row removes a held-region environment/hydro/calendar background.

Shared DOC: 20 pairs / 11 HUC4; complete hydro: 17 / 10; longer record: 13 / 7. Equal-pair means with HUC4 bootstrap 95% intervals.
High DOC: fixed 10 mg/L. Variability: log1p SD. Adjustments describe remaining associations; these are not event peaks or measured buffering rates.
