

# Field separation of river transport and DOC processing

One stream, three paired salt / labelled-DOC releases at both locations. Dots are original measurements; no lab imputation.

Left: salt curves normalized over the same 0-300 min window. Middle/right: concentrations with panel-specific vertical ranges. The conservative reference inherits the author salt/carbon calibration. Core fraction is a paired concentration slope, not full mass recovery. All clocks start at actual release. Salt connections show the sampled shape; the downstream leachate salt tail remains incomplete.
