

Is DOC transmission associated with footprint, branches or channel paths?

Tributary integration

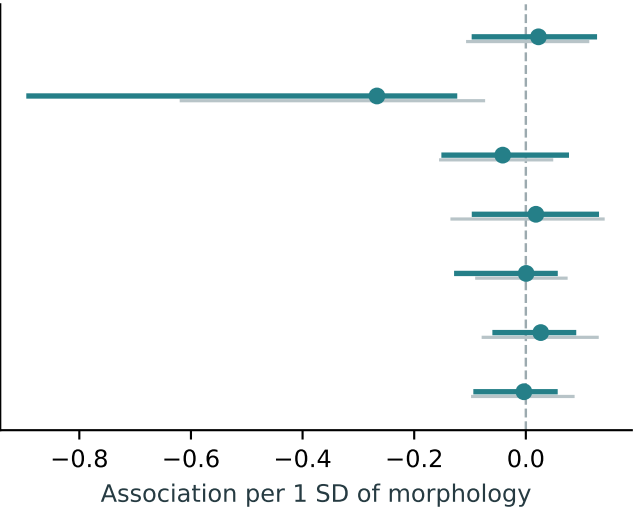

a Anomaly variability

b Signal transmission

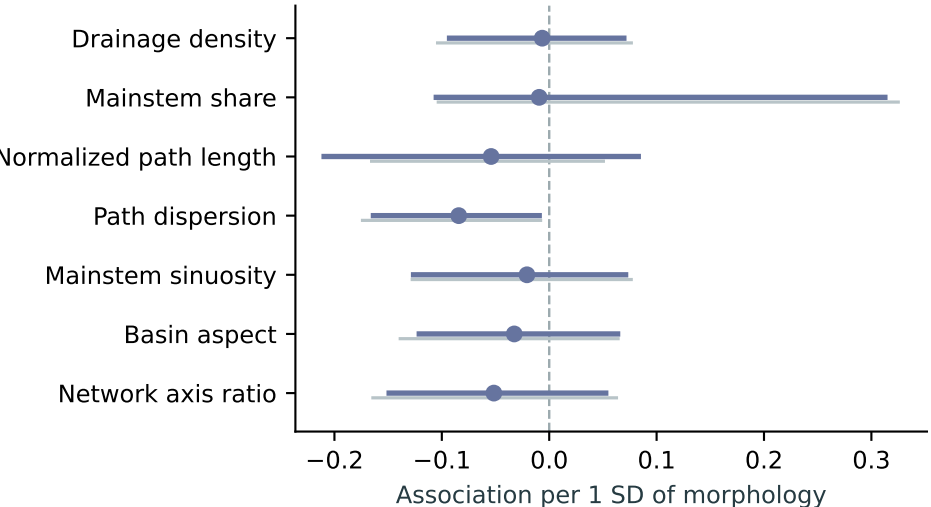

c Mean concentration change

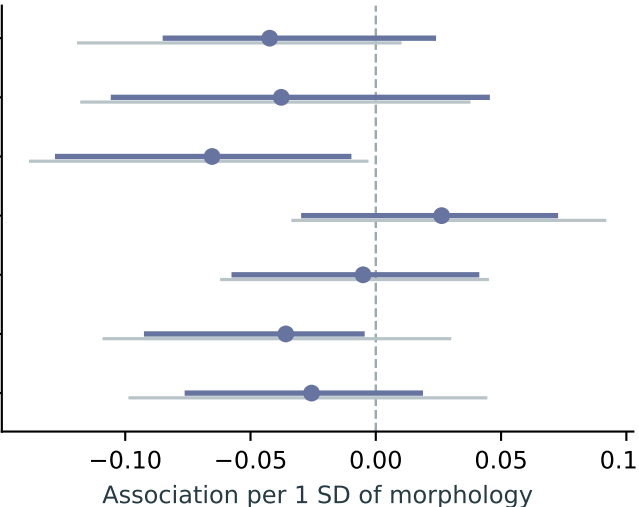

Along-channel evolution

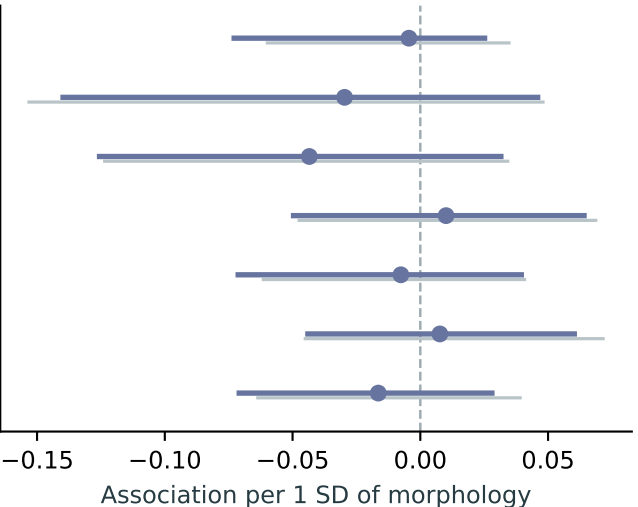

d Anomaly variability

e Signal transmission

f Mean concentration change

One morphology term + fixed connection controls. Thick: connected-system 95% CI; grey: HUC4 sensitivity CI.
Exploratory source-role associations with pointwise intervals; morphology terms are correlated. These are not independent causal effects.
