

How does DOC change from low to high flow within the same river?

● Elongated / tributary-rich ● Mainstem / sparse ● Broad / tributary-rich

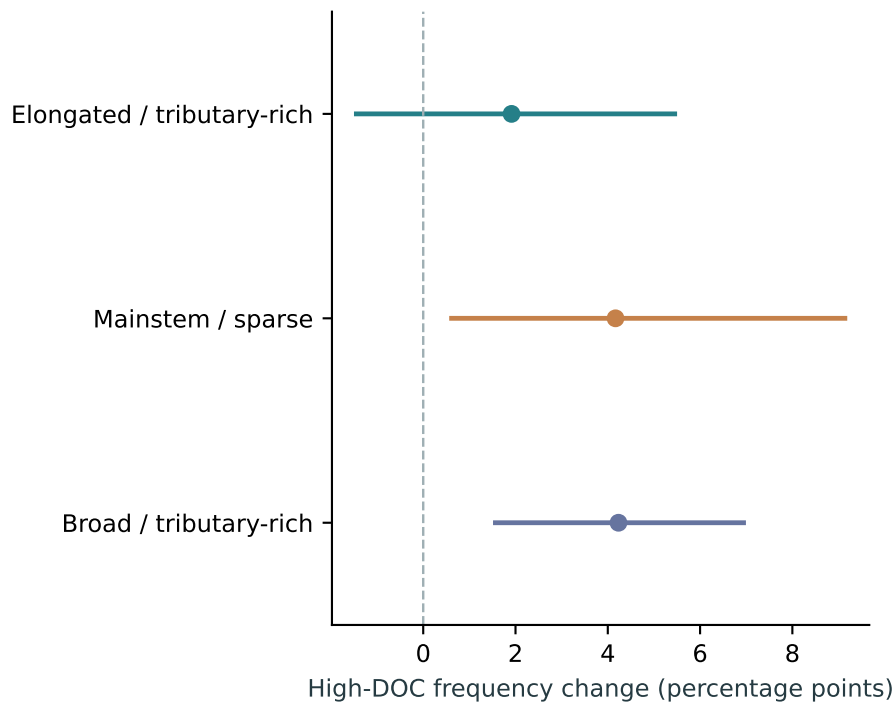

a State means, stations weighted equally

b Season, year and temperature adjustment

c High DOC: fixed 10 mg/L threshold

205 source-role stations / 49 HUC4; elongated 74, sparse 21, broad 110. Station flow terciles use measured flow, including non-DOC months.
b: x unadjusted, ● season/year adjusted, ■ plus temperature. Lines: HUC4 bootstrap 95%. Within-class responses are not class differences.
