

Network forms and tributary layout: distributions and original matches

Saved shortest-route scenario

Top: original 297 networks; entry-position statistics exclude networks without positive-area lateral tributaries.
Bottom: original 22 elongated-broad pairs; equal-pair mean difference, 95% whole-HUC4 bootstrap interval, 12 blocks and 5,000 draws.
Between-unit variance includes tributary mean arrivals and mainstem-local inputs. Outline form, entry position and arrival timing are distinct.
