

Branch balance and arrival timing jointly shape the DOC pulse

Identical integrated source pulses and total flow; only branch flow shares or pulse timing change.

a Same network, different arrival phases

b Balanced branches usually reduce peaks

c Arrival phase can offset buffering

Uniform-speed conservative routing. b/c: 38 receivers; c: connected-system 95%. Integrated anomaly load remains one in every case.
a: fixed median path-imbalance pair, not effect-selected. Aligning arrivals restores input peak, demonstrating the joint role of paths and phase.
