

When does junction position change the downstream DOC signal?

Two fixed source-to-outlet distances; only branch/common partition changes. Top: fixed representative pair. Bottom: 38 receivers.

121 independent tributary pairs / 38 receivers / 17 connected systems; receiver-first averages. Thick: system 95%; grey: HUC4 sensitivity. Speeds and processing are imposed, not DOC-fitted; two monitored branches are not a full basin budget. Virtual splits are not real channel alterations.
